Table 1 MPU-9250 mode register map for Gyroscope and Accelerometer

Note: Register Names ending in _H and _L contain the high and low bytes, respectively, of an internal register value.

In the detailed register tables that follow, register names are in capital letters, while register values are in capital letters and italicized. For example, the ACCEL_XOUT_H register (Register 59) contains the 8 most significant bits, ACCEL_XOUT[15:8], of the 16-bit X-Axis accelerometer measurement, ACCEL_XOUT.

The reset value is 0x00 for all registers other than the registers below.

- Register 107 (0x01) Power Management 1
- Register 117 (0x71) WHO_AM_I

These registers are used to remove DC bias from the gyro sensor data output for X, Y and Z axes. The values in these registers are subtracted from the gyro sensor values before going into the sensor registers. Please refer to registers 67 to 72 for units.

4.4 Register 25 – Sample Rate Divider

Serial IF: R/W Reset value: 0x00

BIT	NAME	FUNCTION
[7:0]	SMPLRT_DIV[7:0]	Divides the internal sample rate (see register CONFIG) to generate the sample rate that controls sensor data output rate, FIFO sample rate. NOTE: This register is only effective when Fchoice = 2'b11 (fchoice_b register bits are 2'b00), and (0 < dlpf_cfg < 7), such that the average filter's output is selected (see chart below).
		This is the update rate of sensor register.
		SAMPLE_RATE= Internal_Sample_Rate / (1 + SMPLRT_DIV)

Data should be sampled at or above sample rate; SMPLRT_DIV is only used for1kHz internal sampling.

[6]	FIFO_MODE	When set to '1', when the fifo is full, additional writes will not be written to fifo. When set to '0', when the fifo is full, additional writes will be written to the fifo, replacing the oldest data.

The data output rate of the DLPF filter block can be further reduced by a factor of 1/(1+SMPLRT_DIV), where SMPLRT_DIV is an 8-bit integer. Following is a small subset of ODRs that are configurable for the accelerometer in the normal mode in this manner (Hz):

3.91, 7.81, 15.63, 31.25, 62.50, 125, 250, 500, 1K

The following table lists the approximate accelerometer filter bandwidths available in the low-power mode of operation.

In the low-power mode of operation, the accelerometer is duty-cycled. Fchoice=0 for all options.

For example, if I2C_SLV0_REG = 0x1, and I2C_SLV0_LENG = 0x4: The first byte read from address 0x1 will be stored at EXT_SENS_DATA_00, the second and third bytes will be read and swapped, so the data read from address 0x2 will be stored at EXT_SENS_DATA_02, and the data read from address 0x3 will be stored at EXT_SENS_DATA_01, The last byte read from address 0x4 will be stored at EXT_SENS_DATA_03 0 - no swapping occurs, bytes are written in order read.

[7:0]	I2C_SLV4_DI[7:0]	Data read from I2C Slave 4.

4.18 Register 54 – I²C Master Status

Serial IF: R/C

BIT	NAME	FUNCTION
[7]	PASS_THROUGH	Status of FSYNC interrupt – used as a way to pass an external interrupt through this chip to the host. If enabled in the INT_PIN_CFG register by asserting bit FSYNC_INT_EN and if the FSYNC signal transitions from low to high, this will cause an interrupt. A read of this register clears all status bits in this register.
[6]	I2C_SLV4_DONE	Asserted when I2C slave 4's transfer is complete, will cause an interrupt if bit I2C_MST_INT_EN in the INT_ENABLE register is asserted, and if the SLV4_DONE_INT_EN bit is asserted in the I2C_SLV4_CTRL register.
[5]	I2C_LOST_ARB	Asserted when I2C slave looses arbitration of the I2C bus, will cause an interrupt if bit I2C_MST_INT_EN in the INT_ENABLE register is asserted.
[4]	I2C_SLV4_NACK	Asserted when slave 4 receives a nack, will cause an interrupt if bit I2C_MST_INT_EN in the INT_ENABLE register is asserted.
[3]	I2C_SLV3_NACK	Asserted when slave 3 receives a nack, will cause an interrupt if bit I2C_MST_INT_EN in the INT_ENABLE register is asserted.
[2]	I2C_SLV2_NACK	Asserted when slave 2 receives a nack, will cause an interrupt if bit I2C_MST_INT_EN in the INT_ENABLE register is asserted.
[1]	I2C_SLV1_NACK	Asserted when slave 1 receives a nack, will cause an interrupt if bit I2C_MST_INT_EN in the INT_ENABLE register is asserted.
[0]	I2C_SLV0_NACK	Asserted when slave 0 receives a nack, will cause an interrupt if bit I2C_MST_INT_EN in the INT_ENABLE register is asserted.

[2]		0 – The logic level for the FSYNC pin as an interrupt is active high.
[2]	FSYNC_INT_MODE_EN	1 – This enables the FSYNC pin to be used as an interrupt. A transition to the active level described by the ACTL_FSYNC bit will cause an interrupt. The status of the interrupt is read in the I2C Master Status register PASS_THROUGH bit.
		0 – This disables the FSYNC pin from causing an interrupt.
[1]	BYPASS_EN	When asserted, the i2c_master interface pins(ES_CL and ES_DA) will go into 'bypass mode' when the i2c master interface is disabled. The pins will float high due to the internal pull-up if not enabled and the i2c master interface is disabled.

4.25 Registers 73 to 96 - External Sensor Data

 $EXT_SENS_DATA_00 - 23$

Serial IF: SyncR Reset value: 0x00

24 registers with the same description as below:

BIT	NAME	FUNCTION
[7:0]	D[7:0]	Sensor data read from external I2C devices via the I2C master interface. The data stored is controlled by the I2C_SLV(0-4)_ADDR, I2C_SLV(0-4)_REG, and I2C_SLV(0-4)_CTRL registers

Description:

These registers store data read from external sensors by the Slave 0, 1, 2, and 3 on the auxiliary I²C interface. Data read by Slave 4 is stored in I2C_SLV4_DI (Register 53).

External sensor data is written to these registers at the Sample Rate as defined in Register 25. This access rate can be reduced by using the Slave Delay Enable registers (Register 103).

Data is placed in these external sensor data registers according to I2C_SLV0_CTRL, I2C_SLV1_CTRL, I2C_SLV2_CTRL, and I2C_SLV3_CTRL (Registers 39, 42, 45, and 48). When more than zero bytes are read (I2C_SLVx_LEN > 0) from an enabled slave (I2C_SLVx_EN = 1), the slave is read at the Sample Rate (as defined in Register 25) or delayed rate (if specified in Register 52 and 103). During each sample cycle, slave reads are performed in order of Slave number. If all slaves are enabled with more than zero bytes to be read, the order will be Slave 0, followed by Slave 1, Slave 2, and Slave 3.

Each enabled slave will have EXT_SENS_DATA registers associated with it by number of bytes read (*I2C_SLVx_LEN*) in order of slave number, starting from EXT_SENS_DATA_00. Note that this means enabling or disabling a slave may change the higher numbered slaves' associated registers. Furthermore, if fewer total bytes are being read from the external sensors as a result of such a change, then the data remaining in the registers which no longer have an associated slave device (i.e. high numbered registers) will remain in these previously allocated registers unless reset.

If the sum of the read lengths of all SLVx transactions exceed the number of available EXT_SENS_DATA registers, the excess bytes will be dropped. There are 24 EXT_SENS_DATA

Document Number: RM-MPU-9250A-00

Revision: 1.4

Release Date: 9/9/2013

registers and hence the total read lengths between all the slaves cannot be greater than 24 or some bytes will be lost.

<u>Note</u>: Slave 4's behavior is distinct from that of Slaves 0-3. For further information regarding the characteristics of Slave 4, please refer to Registers 49 to 53.

Example:

Suppose that Slave 0 is enabled with 4 bytes to be read ($I2C_SLV0_EN = 1$ and $I2C_SLV0_LEN = 4$) while Slave 1 is enabled with 2 bytes to be read, ($I2C_SLV1_EN = 1$ and $I2C_SLV1_LEN = 2$). In such a situation, EXT_SENS_DATA _00 through _03 will be associated with Slave 0, while EXT_SENS_DATA _04 and 05 will be associated with Slave 1.

If Slave 2 is enabled as well, registers starting from EXT_SENS_DATA_06 will be allocated to Slave 2.

If Slave 2 is disabled while Slave 3 is enabled in this same situation, then registers starting from EXT_SENS_DATA_06 will be allocated to Slave 3 instead.

Register Allocation for Dynamic Disable vs. Normal Disable

If a slave is disabled at any time, the space initially allocated to the slave in the EXT_SENS_DATA register, will remain associated with that slave. This is to avoid dynamic adjustment of the register allocation.

The allocation of the EXT_SENS_DATA registers is recomputed only when (1) all slaves are disabled, or (2) the *I2C_MST_RST* bit is set (Register 106).

This above is also true if one of the slaves gets NACKed and stops functioning.

- (i) Set CYCLE bit to 1
- (ii) Set SLEEP bit to 0
- (iii) Set TEMP_DIS bit to 1
- (iv) Set DIS_XG, DIS_YG, DIS_ZG bits to 1

The bits mentioned in the steps (i) to (iii) can be found in Power Management 1 register (Register 107).

4.37 Register 116 - FIFO Read Write

Name: FIFO_R_W
Serial IF: R/W
Paget value: 0x00

Reset value: 0x00

BIT	NAME	FUNCTION
[7:0]	D[7:0]	Read/Write command provides Read or Write operation for the FIFO.

Description:

This register is used to read and write data from the FIFO buffer.

Data is written to the FIFO in order of register number (from lowest to highest). If all the FIFO enable flags (see below) are enabled and all External Sensor Data registers (Registers 73 to 96) are associated with a Slave device, the contents of registers 59 through 96 will be written in order at the Sample Rate.

The contents of the sensor data registers (Registers 59 to 96) are written into the FIFO buffer when their corresponding FIFO enable flags are set to 1 in FIFO_EN (Register 35). An additional flag for the sensor data registers associated with I²C Slave 3 can be found in I2C_MST_CTRL (Register 36).

If the FIFO buffer has overflowed, the status bit FIFO_OFLOW_INT is automatically set to 1. This bit is located in INT_STATUS (Register 58). When the FIFO buffer has overflowed, the oldest data will be lost and new data will be written to the FIFO unless register 26 CONFIG, bit[6] FIFO_MODE = 1.

Document Number: RM-MPU-9250A-00

Revision: 1.4

Release Date: 9/9/2013

If the FIFO buffer is empty, reading this register will return the last byte that was previously read from the FIFO until new data is available. The user should check *FIFO_COUNT* to ensure that the FIFO buffer is not read when empty.

HOFL: Magnetic sensor overflow

"0": Normal

"1": Magnetic sensor overflow occurred

In single measurement mode, continuous measurement mode, external trigger measurement mode and self-test mode, magnetic sensor may overflow even though measurement data regiseter is not saturated. In this case, measurement data is not correct and HOFL bit turns to "1". When next measurement stars, it returns to "0".

BITM: Output bit setting (mirror)

"0": 14-bit output 16-bit output

Mirror data of BIT bit of CNTL1 register.

ST2 register has a role as data reading end register, also. When any of measurement data register is read in continuous measurement mode or external trigger measurement mode, it means data reading start and taken as data reading until ST2 register is read. Therefore, when any of measurement data is read, be sure to read ST2 register at the end.

This register disables I²C bus interface. I²C bus interface is enabled in default. To disable I²C bus interface, write "00011011" to I2CDIS register. Then I²C bus interface is disabled.

Once I²C bus interface is disabled, it is impossible to write other value to I2CDIS register. To enable I2C bus interface, reset AK8963 or input start condition 8 times continuously.

Sensitivity adjustment data for each axis is stored to fuse ROM on shipment.

ASAX[7:0]: Magnetic sensor X-axis sensitivity adjustment value ASAY[7:0]: Magnetic sensor Y-axis sensitivity adjustment value ASAZ[7:0]: Magnetic sensor Z-axis sensitivity adjustment value

■ Sensitivity Adjustment

The sensitivity adjustment is done by the equation below;

$$Hadj = H \times \left(\frac{(ASA - 128) \times 0.5}{128} + 1\right),$$

where H is the measurement data read out from the measurement data register, ASA is the sensitivity adjustment value, and Hadj is the adjusted measurement data.
